2. (5 pts). A widely used undergraduate experiment is the recrystallization of acetanilide from water. Acetanilide (structure shown below) is moderately soluble in hot water, but much less soluble in cold water. Identify one structural feature of the acetanilide molecule that would be expected to contribute positively to its solubility in water and one that would be expected to contribute negatively.

4. (9 pts). Three alkyl halides, each with the formula C<sub>7</sub>H<sub>15</sub>Br, have different boiling points. One of the compounds is optically active. Following reaction with Mg in ether, then with water, each compound gives 2, 4-dimethylpentane. After the same reaction with D<sub>2</sub>O instead of water, a different product is obtained from each compound. Suggest a structure for each of the three alkyl halides.

5. (6 pts)

$$\begin{aligned} \text{Relative abundance} &= \frac{\text{abundance } C^{13}}{\text{abundance } C^{12}} \\ &= (\# \text{ of } C) \times \left( \frac{\text{Natural abundance of } ^{13}\text{C}}{\text{Natural abundance of } ^{12}\text{C}} \right) \\ &= (\# \text{ of } C) \times \left( \frac{0.0107}{0.9893} \right) \end{aligned}$$

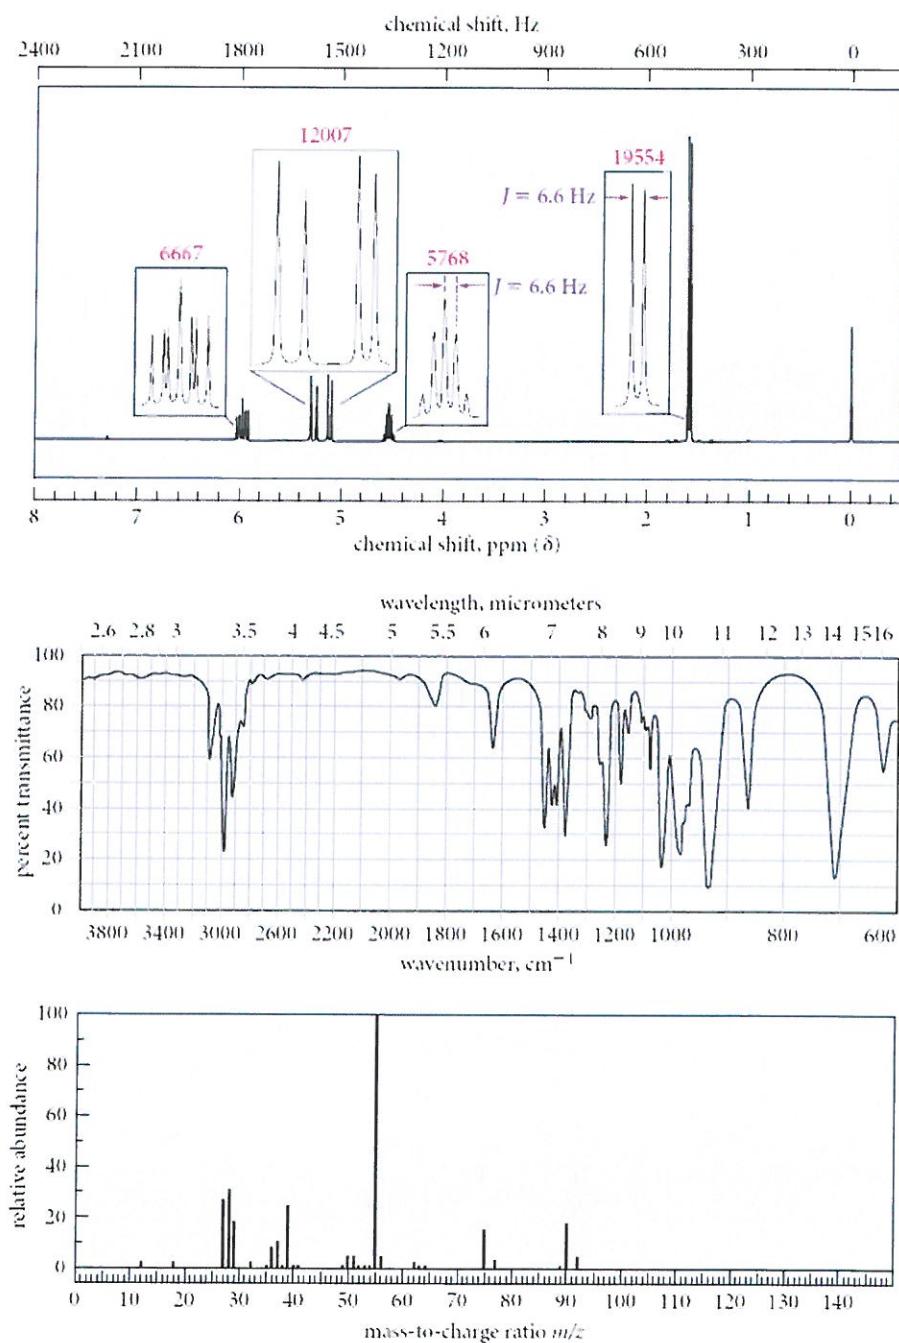

$$\frac{0.02702}{0.4996} = (\# \text{ of } C) \times 0.0111$$

$$\# \text{ of } C \approx 5$$
